

## WHAT IS CLAIMED IS:

1. A speech complementing apparatus comprising:  
speech input means for inputting a speech;  
5 speech recognition means for recognizing the  
inputted speech;  
detecting means for detecting a word fragment in the  
result of recognizing by said speech recognition means,  
the fragment giving information about which part to be  
10 complemented; and  
complementing means for complementing the result of  
recognizing by said speech recognition means based on the  
detected word fragment.
- 15 2. The speech complementing apparatus as claimed in  
claim 1, wherein in said detecting means, the word fragment  
to be complemented is specified by detecting the period  
of the filled pause in the inputted speech from said speech  
input means.
- 20 3. The speech complementing apparatus as claimed in  
claim 2, wherein said word fragment is the result of  
recognizing before said period of the filled pause.
- 25 4. The speech complementing apparatus as claimed in  
claim 1, wherein in said detecting means, the word fragment  
to be complemented is specified by detecting a predefined

key-word string in the result of recognizing by said speech recognition means.

5. The speech complementing apparatus as claimed in  
5 claim 4, wherein said word fragment is the result of recognizing after said predefined key-word string.

6. The speech complementing apparatus as claimed in  
10 claim 1, further comprising selecting means for selecting a complementary candidate when said word fragment is complemented and a plurality of complementary candidates are existing.

7. A speech complementing method comprising:  
15 a speech input step for inputting a speech;  
a speech recognition step for recognizing the inputted speech;  
a detecting step for detecting a word fragment in the result of recognizing by said speech recognition step, the  
20 fragment giving information about which part to be complemented; and  
a complementing step for complementing the result of recognizing by said speech recognition step based on the detected word fragment.

25

8. The speech complementing method as claimed in claim 7, wherein in said detecting step, the word fragment to

be complemented is specified by detecting the period of the filled pause in the inputted speech in said speech input step.

5 9. The speech complementing method as claimed in claim 8, wherein said word fragment is the result of recognizing before said period of the filled pause.

10 10. The speech complementing method as claimed in claim 7, wherein in said detecting step, the word fragment to be complemented is specified by detecting a predefined key-word string in the result of recognizing in said speech recognition step.

15 11. The speech complementing method as claimed in claim 10, wherein said word fragment is the result of recognizing after said predefined key-word string.

20 12. The speech complementing method as claimed in claim 7, further comprising a selecting step for selecting a complementary candidate when said word fragment is complemented and a plurality of complementary candidates are existing.

25 13. A recording medium which stores a program executed in a complementing apparatus, said program comprising:  
a speech input step for inputting a speech;

a speech recognition step for recognizing the inputted speech;

a detecting step for detecting a word fragment in the result of recognizing by said speech recognition step, the  
5 fragment giving information about which part to be complemented; and

a complementing step for complementing the result of recognizing by said speech recognition step based on the detected word fragment.

10

14. The recording medium as claimed in claim 13, wherein in said detecting step, the word fragment to be complemented is specified by detecting the period of the filled pause in the inputted speech in said speech input  
15 step.

15

15. The recording medium as claimed in claim 14, wherein said word fragment is the result of recognizing before said period of the filled pause.

20

16. The recording medium as claimed in claim 13, wherein in said detecting step, the word fragment to be complemented is specified by detecting a predefined key-word string in the result of recognizing in said speech  
25 recognition step.

25

17. The recording medium as claimed in claim 16, wherein

Handwritten mark resembling a stylized 'R' or 'B'.

009749743.122800

said word fragment is the result of recognizing after said predefined key-word string.

18. The recording medium as claimed in claim 13, said  
5 program further comprises a selecting step for selecting  
a complementary candidate when said word fragment is  
complemented and a plurality of complementary candidates  
are existing.
